

# Views, the parallax effect

Fabrice.Kordon@lip6.fr

# As an introduction...

## Introduced with iOS7

- Provides a «deep space» impression
- Nice for games

## Small impact on the autonomy

- Movement co-processor involved
  - ▶ Since iPhone 5s/iPad air/Ipad mini retina

## How to access such mechanisms

- UIDynamicItem (et UIDynamicItem protocole)
- UIMotionEffect
  - ▶ Customizable 3D effects
- UIInterpolationMotionEffect
  - ▶ predefined 3D effects (e.g. parallax effect)

# Enrichment of UIView

## Major update

- Property : `motionEffects`
  - ▶ Array of `UIMotionEffect`
- Adding and suppressing effects

## Effects can be reused

- You must associate an effect to all the involved views

# Observing the parallax effect

4

# Principles

## I — elaborate an effect

- Use of `UIInterpolatingMotionEffect`
  - ▶ Several possible effects
- For the parallax one
  - ▶ `UIInterpolatingMotionEffectTypeTiltAlongHorizontalAxis`  
`TiltAlongHorizontalAxis`
  - ▶ `UIInterpolatingMotionEffectTypeTiltAlongVerticalAxis`  
`TiltAlongVerticalAxis`
- Do not forget its amplitude
  - ▶ 20 pts recommended

## II — add these effects to the view

- `addMotionEffect:` / `addMotionEffect`

## iOS does it for you then

# Setting up the parallax effect

```
private let label = UILabel()

convenience init(frame : CGRect) {
    self.init()
    let img = UIImage(named: "Encelade")
    let imgv = UIImageView(image: img)
    let scale = frame.height / img!.size.height
    imgv.frame = CGRect(x: 0.0, y: 0.0,
                        width: img!.size.width * scale + 50.0,
                        height: img!.size.height * scale + 50.0)

    self.view = UIView()
    self.view.addSubview(imgv)
    let effectH = UIInterpolatingMotionEffect(keyPath: "center.x",
                                              type: .tiltAlongHorizontalAxis)
    effectH.minimumRelativeValue = -50.0 // 20 recommended by Apple
    effectH.maximumRelativeValue = 50.0
    let effectV = UIInterpolatingMotionEffect(keyPath: "center.y",
                                              type: .tiltAlongVerticalAxis)
    effectV.minimumRelativeValue = -50.0 // 20 recommended by Apple
    effectV.maximumRelativeValue = 50.0
    imgv.addMotionEffect(effectH)
    imgv.addMotionEffect(effectV)
    label.text = "Encelade"
    label.textColor = UIColor.black
    label.textAlignment = .center
    label.font = UIFont.boldSystemFont(ofSize: 28.0)
    self.view.addSubview(label)
    self.displayLabel(frame.size)
}
```

# Setting up the parallax effect

```
private let label = UILabel()
```

```
convenience init(frame : CGRect) {
```

```
    self.init()
```

```
    let img = UIImage(named: "Encelade")
```

```
    let imgv = UIImageView(image: img)
```

```
    let scale = frame.height / img!.size.height
```

```
    imgv.frame = CGRect(x: 0, y: 0, width: img!.size.width * scale, height: img!.size.height * scale)
```

```
    self.view.addSubview(imgv)
```

```
    self.view.addSubview(label)
```

```
    let effectH = UIInterpolatingMotionEffect(
```

```
        type: UIInterpolatingMotionEffectTypeTiltAlongVerticalAxis];
```

```
    effectH.minimumRelativeValue = -50.0 // 20 recommended by Apple
```

```
    effectH.maximumRelativeValue = 50.0
```

```
    let effectV = UIInterpolatingMotionEffect(
```

```
        type: UIInterpolatingMotionEffectTypeTiltAlongVerticalAxis];
```

```
    effectV.minimumRelativeValue = -50.0 // 20 recommended by Apple
```

```
    effectV.maximumRelativeValue = 50.0
```

```
    imgv.addMotionEffect(effectH)
```

```
    imgv.addMotionEffect(effectV)
```

```
    label.text = "Encelade"
```

```
    label.textColor = UIColor.black
```

```
    label.textAlignment = .center
```

```
    label.font = UIFont.boldSystemFont(ofSize: 28.0)
```

```
    self.view.addSubview(label)
```

```
    self.displayLabel(frame.size)
```

```
}
```

## In Objective-C

```
UIInterpolatingMotionEffect *vMotionEffect =  
[[UIInterpolatingMotionEffect alloc]  
 initWithKeyPath:@"center.y"  
 type:UIInterpolatingMotionEffectTypeTiltAlongVerticalAxis];  
[vMotionEffect setMinimumRelativeValue:@(-50)];  
[vMotionEffect setMaximumRelativeValue:@(+50)];  
...  
[myView addMotionEffect:vMotionEffect];
```

```
effectV.minimumRelativeValue = -50.0 // 20 recommended by Apple
```

```
effectV.maximumRelativeValue = 50.0
```

```
imgv.addMotionEffect(effectH)
```

```
imgv.addMotionEffect(effectV)
```

```
label.text = "Encelade"
```

```
label.textColor = UIColor.black
```

```
label.textAlignment = .center
```

```
label.font = UIFont.boldSystemFont(ofSize: 28.0)
```

```
self.view.addSubview(label)
```

```
self.displayLabel(frame.size)
```

# Grouping effects

## E.g. effects on two dimensions?

- UIMotionEffectGroup
- Array of UIMotionEffect

### ▶ Same behavior

```
let img = UIImage(named: "Encelade")
let imgv = UIImageView(image: img)
...
self.view.addSubview(imgv)
let effectH = UIInterpolatingMotionEffect(keyPath: "center.x",
                                           type: .tiltAlongHorizontalAxis)
effectH.minimumRelativeValue = -50.0 // 20 recommended by Apple
effectH.maximumRelativeValue = 50.0
let effectV = UIInterpolatingMotionEffect(keyPath: "center.y",
                                           type: .tiltAlongVerticalAxis)
effectV.minimumRelativeValue = -50.0 // 20 recommended by Apple
effectV.maximumRelativeValue = 50.0
let group = UIMotionEffectGroup()
group.motionEffects = [effectH, effectV]
imgv.addMotionEffect(group)
```

# Handling some perspective

## Possible at low cost

- 🎧 Useful in games
- 🎧 Perspective effect
  - ▶ **Move of planes with different amplitudes**

# As a conclusion...

 You can have your apps look smarter

 It's easy

 But  ..

-  «vomit effect»
-  Increase (a bit) power consumption
